

4<sup>th</sup> June 2013

## CONSTRUCTION UPDATE – SYDNEY PORT BOTANY TERMINAL 3

### Works Undertaken

Construction activities that have taken place on the Terminal 3 site during May 2013 are outlined below:

- Noise wall construction has continued and expected to be completed over the next couple of months
- Paving across the site has allowed delivery of the first SICTL automated stacking crane load to the Terminal 3 site
- Electrical substation and drainage works are continuing including installation of the Stormwater Quality Improvement Devices (SQIDs) has continued. The SQIDs will allow for treatment of Terminal 3 stormwater once the facility is operational.
- Services works have proceeded across the site which encompasses electrical, and potable water infrastructure
- Concrete batch plant and paving operations have continued and undertaken some evening works during May. All evening works have been assessed as inaudible at residential areas by an independent consultant. The benefits of having this plant on site is the ability to keep concrete trucks off the surrounding road networks and avoid impacting local residents and road users
- Works on the future rail siding has proceeded with ground improvements being undertaken to allow installation of track later this year.

**First delivery of Terminal 3 automated stacking crane equipment in late May 2013.**

## Coming Up

Laing O'Rourke will continue with the work activities listed above.

## Project Information

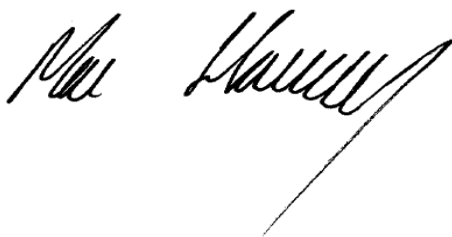

Further information regarding the SPBT3 project can be found on the Hutchison Ports Australia website as shown in the contact details below. Project information will be updated throughout the project to reflect the relevant stages of work.

## Contact Details

Laing O'Rourke is committed to providing ongoing information about any works on site. For further information please use the contacts shown below.
