

4<sup>th</sup> March 2013

## CONSTRUCTION UPDATE – SYDNEY PORT BOTANY TERMINAL 3

### Works Undertaken

Construction activities that have taken place on the Terminal 3 site during February 2013 are outlined below:

- Construction of the Automated Stacking Cranes (ASC) rail beams has continued with rail expected to be installed in the next month
- Ground improvement of the reclaimed land is continuing. These works involve the placement of engineered and quarried material to ensure the grounds are stable prior to placing concrete
- Drainage works have continued for the operational terminal's stormwater system
- Services works have proceeded across the site which encompasses electrical, services, water and sewer infrastructure
- The concrete batch plant is now up and running and being used in construction of the ASC rail beams and pavement for the new terminal. The benefits of having this plant on site is the ability to keep concrete trucks off the surrounding road networks and avoid impacting local residents and road users. Some 'out of hours' concrete works may need to be undertaken during the project with appropriate notifications and controls to be in place for these works.

Construction of one of the electrical substations on the Terminal 3 site
