

4th April 2013

CONSTRUCTION UPDATE – SYDNEY PORT BOTANY TERMINAL 3

Works Undertaken

Construction activities that have taken place on the Terminal 3 site during March 2013 are outlined below:

- Noise wall construction has begun on the northern perimeter of the site.
- Paving of the Automated Stacking Crane (ASC) rail beams has continued with rail to be installed this month
- Ground improvement of the reclaimed land is continuing
- Electrical substation construction is being undertaken
- Drainage and headwall works are continuing
- Services works have proceeded across the site which encompasses electrical, and potable water infrastructure
- Concrete batch plant and paving operations have continued. The benefits of having this plant on site is the ability to keep concrete trucks off the surrounding road networks and avoid impacting local residents and road users. Notifications of possible out of hours works have been distributed to surrounding residents. Noise trials have been undertaken with all works being assessed as inaudible at residential areas.

Paving works for the ASC rail beams

Coming Up

Laing O'Rourke will continue with the current work activities listed above.

Project Information

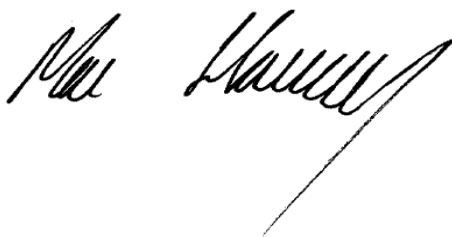

Further information regarding the SPBT3 project can be found on the Hutchison Ports Australia website as shown in the contact details below. Project information will be updated throughout the project to reflect the relevant stages of work.
